European Economic Area (EEA) developers

If your billing address is in the European Economic Area, effective on 8 July 2025, the Google Maps Platform EEA Terms of Service (https://cloud.google.com/terms/maps-platform/eea) will apply to your use of the Services. Functionality varies by region. Learn more (/maps/comms/eea/faq).

Introduction

Place types are categories that identify the characteristics of a place. A place can have one or more place types assigned to it.

A place's types are included in the **response** from a Place Details (New), Nearby Search (New), Text Search (New), and Autocomplete (New) request:

- A place can have a **single primary type** from type Table A (#table-a) or type Table B (#table-b) associated with it. For example, the **primary type** might be `mexican_restaurant` or `steak_house`.The **primary type** may be missing if the place's primary type is not a supported type. When a **primary type** is present, it is always one of the **types** in the `types` field.
- A place can have **multiple type values** from type Table A (#table-a) or type Table B (#table-b) associated with it. For example a restaurant might have the following **types**: `seafood_restaurant`, `restaurant`, `food`, `point_of_interest`, `establishment`.

- The address and address components of a place can be tagged with certain types from the Address types and address component types (#address-types) table. For example, an address might be tagged as an `street_address` and a component of the address might be tagged as a `street_number`.

You can also specify place types as part of a **request**. When specified in the request, the type acts as a filter to restrict the response to only include places that match the specified types.

About the type tables

Table A (#table-a) lists the types that are used in the following ways:

- As part of a response from Place Details (New), Nearby Search (New), and Text Search (New). The request must specify at least one of the `places.types` or `places.primaryType` fields in the field mask. The values in Table A are then used to populate those

fields.

- As part of a Nearby Search (New) request, used as the value of the `includedTypes`, `excludedTypes`, `includedPrimaryTypes`, and `excludedPrimaryTypes` parameter. The values in Table B are then used to populate those fields.
- As part of a Text Search (New) request, used as the value of the `includedType` parameter.
- As part of an Autocomplete (New) request, use as the values to the `includedPrimaryTypes` parameter.
- As part of an Autocomplete (New) response.

Table B (#table-b) lists additional place type values which may also be returned as part of a Place Details (New), Nearby Search (New), Text Search (New), and Autocomplete (New) response. The request must specify at least one of the `places.types` or `places.primaryType` fields in the field mask. Values from Table B may NOT be used as part of a request, except as the values to the `includedPrimaryTypes` parameter for a Autocomplete (New) request.

Table C (#table-c) lists type collections that can be used as the value of the `includedPrimaryTypes` parameter in an Autocomplete (New) request. Type collections can't be specified with any other type values.

Address types and address component types (#address-types) list types that may appear in either or both address type and address component type arrays in the response body. Address component types are subject to change.

Table B

The Place type values in Table B may be returned as part of a Place Details (New), Nearby Search (New), Text Search (New), or Autocomplete (New) response. These types are also supported by `includedPrimaryTypes` for

Autocomplete (New) requests.

Additional Place type values

```

Table C

Type collections can be used as the `includedPrimaryTypes` value in Autocomplete (New) requests. Using a type collection returns all results that match any of the associated included types. Type collections can't be specified with any other type values.

Note: For better results, users should select specific types from Table A (#table-a) and Table B (#table-b).

Type collection	Included types
`(regions)`	Filters for areas or divisions, such as neighborhoods and postal codes.
`(cities)`	Filters for places that Google identifies as a city.

Address types and address component types

The `types` array in the response indicates the *address type*. Examples of address types include a street address, a

country, or a political entity. The `types` array in the `AddressComponent` field indicates the type of each part of the address. Examples include street number or country.

Addresses may have multiple types. The types may be considered 'tags'. For example, many cities are tagged with the `political` and `locality` types.

The following types are supported and returned in both the address type and address component type arrays:

Address Type	Description
`street_address`	A precise street address.
`route`	A named route (such as "US 101"
`intersection`	A major intersection, usually of tw major roads.
`political`	A political entity. Usually, this typ indicates a polygon of some civil administration.
`country`	The national political entity, and i typically the highest order type

Address Type	Description
	returned by the Geocoder.
`administrative_area_level_1`	A first-order civil entity below the country level. Within the United States, these administrative level are states. Not all nations exhibit these administrative levels. In mo cases, `administrative_area_leve` short names will closely match IS 3166-2 subdivisions and other widely circulated lists; however th is not guaranteed as our geocodi results are based on a variety of signals and location data.
`administrative_area_level_2`	A second-order civil entity below country level. Within the United States, these administrative level are counties. Not all nations exhi these administrative levels.

Address Type	Description
`administrative_area_level_3`	A third-order civil entity below the country level. This type indicates minor civil division. Not all nation exhibit these administrative level
`administrative_area_level_4`	A fourth-order civil entity below t country level. This type indicates minor civil division. Not all nation exhibit these administrative level
`administrative_area_level_5`	A fifth-order civil entity below the country level. This type indicates minor civil division. Not all nation exhibit these administrative level
`administrative_area_level_6`	A sixth-order civil entity below th country level. This type indicates minor civil division. Not all nation exhibit these administrative level
`administrative_area_level_7`	A seventh-order civil entity below the country level. This type indica a minor civil division. Not all nati exhibit these administrative level

Address Type	Description
`colloquial_area`	A commonly-used alternative nar for the entity.
`locality`	An incorporated city or town political entity.
`sublocality`	A first-order civil entity below a locality. For some locations may receive one of the additional type `sublocality_level_1` to `sublocality_level_5`. Each sublocality level is a civil entity. Larger numbers indicate a smalle geographic area.
`neighborhood`	A named neighborhood.
`premise`	A named location, usually a build or collection of buildings with a common name.
`subpremise`	An addressable entity below the premise level, such as an apartm unit, or suite.

Address Type	Description
`plus_code`	An encoded location reference, derived from latitude and longitu Plus codes can be used as a replacement for street addresses places where they do not exist (where buildings are not numbere or streets are not named). See https://plus.codes (https://plus.codes) for details.
`postal_code`	A postal code as used to address postal mail within the country.
`natural_feature`	A prominent natural feature.
`airport`	An airport.
`park`	A named park.
`point_of_interest`	A named point of interest. Typica these "POI"s are prominent local entities that don't easily fit in another category, such as "Empir State Building" or "Eiffel Tower".

An empty list of types indicates there are no known types for the particular address component (for example, Lieu-dit in France).

In addition to the above, address components may include the types listed below.

Note: This list is not exhaustive, and is subject to change.

Address Component Type	Description
`floor`	The floor of a building address.
`establishment`	Typically a place that has not yet been categorized.
`landmark`	A nearby place that is used as a reference, to aid navigation.
`point_of_interest`	A named point of interest.
`parking`	A parking lot or parking structure.
`post_box`	A specific postal box.

Address Component Type	Description
`postal_town`	A grouping of geographic areas, such as `locality` and `sublocality`, used for mailing addresses in some countries.
`room`	The room of a building address.
`street_number`	The precise street number.
`bus_station`, `train_station` and `transit_station`	The location of a bus, train or public transit stop.
